2. Prediction by Numerical Methods of Self-Sustained Oscillations in a Two-Axis Model of the Nonlinear Sampled-Data LST System

2-1. Introduction

It has been demonstrated in [2] that the stability equations as a result of the describing function analysis may be solved by a numerical-iterative technique. In Chapter 1, the numerical technique is applied to the prediction of self-sustained oscillations in a two-axis model of the nonlinear LST system with continuous-data. In this chapter the same numerical technique will be extended to the prediction of self-sustained oscillations in a two-axis model of the nonlinear LST system with sampled-data.

In the two-axis model of the LST system, the system contains two nonlinearities, and the general form of the stability equation in the sampled-data case is

$$1 + \hat{G}_B(T,n)N(A,n,\phi) + \hat{G}_C(T,n)N^2(A,n,\phi) = 0 \quad (2-1)$$

where $G_B(T,n)$ and $G_C(T,n)$ are transfer functions which describe the linear elements of the coupled systems, and $N(A,n,\phi)$ represents the discrete describing function of the CMG nonlinearity. The amplitude of the sinusoidal signal at the input of the nonlinearities is denoted by A ; T is the sampling period in second, and n is the integer which relates the period of the sustained oscillation to the sampling period; ϕ is the phase angle of the input sinusoid. Therefore,

$$T_C = nT = \text{period of sustained oscillation} \quad (2-2)$$

or

$$\omega_C = \frac{2\pi}{nT} = \text{frequency of sustained oscillation in rad/sec} \quad (2-3)$$

2-2. The Sampled-Data Two-Axis LST System Model and Its Stability Equation

Figure 2-1 illustrates the signal flow graph representation of the sampled-data single-axis LST system. The nonlinear friction of the CMG is modeled by the branch with the gain N , where strictly, N denotes the discrete describing function $N(A, n, \phi)$. The sample-and-hold at the input of the nonlinearity is added for analytical purposes, so that the overall system may be treated by the z-transform method. Since the actual system does not have the sample-and-hold preceding N , the system configuration of Fig. 2-1 should be considered as an approximation to the sampled-data single-axis LST system.

Figure 2-2 shows the two-axis model of the LST system, with the coupling made at the output stages. The coupling coefficients K_2 and K_3 may be varied for various degrees of coupling between the two single-axis systems.

For the study of self-sustained oscillations, we set $x_1 = x_2 = 0$. From the signal flow graph of Fig. 2-2, the following cause-and-effect relationships are written for the variables at the outputs of the four samplers:

$$E_1^* = -A_1^* E_1^* + A_3^* N^* X_1^* + A_2^* E_2^* - A_4^* N^* X_2^* \quad (2-4)$$

$$E_2^* = -A_1^* E_2^* + A_3^* N^* X_2^* + A_2^* E_1^* - A_4^* N^* X_1^* \quad (2-5)$$

$$G_3(s) = \frac{K_p s + K_I}{s}$$

$$G_1(s) = K_0 + K_1 s$$

$$G_6(s) = \frac{1}{J_G s}$$

$$G_2(s) = \frac{K_I}{K_p s + K_I}$$

$$G_7(s) = \frac{1}{J_V s^2}$$

$$G_{ho}(s) = \frac{1 - e^{-Ts}}{s}$$

Figure 2-1. The single-axis sampled-data LST system model.

Figure 2-2. The two-axis sampled-data LST system model.

$$X_1^* = -B_1^* N^* X_1^* + B_2^* E_1^* \quad (2-6)$$

$$X_2^* = -B_1^* N^* X_2^* + B_2^* E_2^* \quad (2-7)$$

where

$$A_1 = \frac{G_{ho} G_1 G_2 G_3 G_4 G_6 H \Delta_1}{\Delta_0} \quad (2-8)$$

$$A_2 = \frac{G_{ho} G_1 G_2 G_3 G_4^2 G_6 H K_2 \Delta_1}{\Delta_0} = A_1 G_4 K_2 \quad (2-9)$$

$$A_3 = \frac{G_{ho} G_1 G_4 G_6 H \Delta_1}{\Delta_0} \quad (2-10)$$

$$A_4 = \frac{G_{ho} G_1 G_4^2 G_6 H K_2 \Delta_1}{\Delta_0} = A_3 G_4 K_2 \quad (2-11)$$

$$B_1 = \frac{G_{ho} G_6 \Delta_2}{s \Delta_0} \quad (2-12)$$

$$B_2 = \frac{G_{ho} G_2 G_3 G_6 \Delta_2}{s \Delta_0} = B_1 G_2 G_3 \quad (2-13)$$

$$\Delta_1 = 1 + G_3 G_6 \quad (2-14)$$

$$\Delta_0 = 1 + 2G_3 G_6 - K_2^2 G_4^2 + G_3^2 G_6^2 - 2G_3 G_4^2 G_6 K_2^2 - G_3^2 G_4^2 G_6^2 K_2^2 \quad (2-15)$$

$$\Delta_2 = 1 + G_3 G_6 - G_3 G_6 K_2^2 G_4^2 - K_2^2 G_4^2 \quad (2-16)$$

In the last nine equations all functions are functions of s . The sampled signal flow graph of the system is drawn in Fig. 2-3 using Eqs. (2-4) through (2-7).

The determinant of the sampled signal flow graph is obtained from Fig. 2-3 by use of Mason's gain formula. The expression is given in terms of the z-transform functions:

Figure 2-3. Sampled signal flow graph of the two-axis sampled-data LST system.

$$\begin{aligned}
\Delta(z) = & [1 + 2A_1(z) - A_2^2(z) + A_1^2(z)] + 2N(A, n, \phi)[B_1(z) - B_2(z)A_3(z) \\
& + A_2(z)B_2(z)A_4(z) + 2A_1(z)B_1(z) - A_1(z)A_3(z)B_2(z) + A_1^2(z)B_1(z) \\
& - A_2^2(z)B_1(z)] + N^2(A, n, \phi)[B_1^2(z) - A_4^2(z)B_2^2(z) - 2B_1(z)B_2(z)A_3(z) \\
& + A_3^2(z)B_2^2(z) + 2A_2(z)A_4(z)B_1(z)B_2(z) + 2A_1(z)B_1^2(z) \\
& - 2A_1(z)A_3(z)B_1(z)B_2(z) + A_1^2(z)B_1^2(z) - A_2^2(z)B_1^2(z)]
\end{aligned} \tag{2-17}$$

The components of $\Delta(z)$ are determined as follows:

$$A_1(z) = (1 - z^{-1}) \mathfrak{Z} \left\{ \frac{K_I H J_V (K_0 + K_1 s) (J_G s^2 + K_p s + K_I) (s^2 + K_3 s + K_2)}{s \Delta_{op}} \right\} \tag{2-18}$$

$$A_2(z) = (1 - z^{-1}) \mathfrak{Z} \left\{ \frac{K_I K_2 H (K_0 + K_1 s) (J_G s^2 + K_p s + K_I)}{\Delta_{op}} \right\} \tag{2-19}$$

$$A_3(z) = (1 - z^{-1}) \mathfrak{Z} \left\{ \frac{H J_V (K_0 + K_1 s) (J_G s^2 + K_p s + K_I) (s^2 + K_3 s + K_2)}{\Delta_{op}} \right\} \tag{2-20}$$

$$A_4(z) = (1 - z^{-1}) \mathfrak{Z} \left\{ \frac{H K_2 (K_0 + K_1 s) (J_G s^2 + K_p s + K_I)}{\Delta_{op}} \right\} \tag{2-21}$$

$$B_1(z) = (1 - z^{-1}) \mathfrak{Z} \left\{ \frac{(J_G s^2 + K_p s + K_I) [J_V^2 (s^2 + K_3 s + K_2)^2 - K_2^2]}{s \Delta_{op}} \right\} \tag{2-22}$$

$$B_2(z) = (1 - z^{-1}) \mathfrak{Z} \left\{ \frac{K_I (J_G s^2 + K_p s + K_I) [J_V^2 (s^2 + K_3 s + K_2)^2 - K_2^2]}{s^2 \Delta_{op}} \right\} \tag{2-23}$$

$$\begin{aligned}
\Delta_{op} = & [J_G^2 s^4 + 2K_p J_G s^3 + (K_p^2 + 2K_I J_G) s^2 + 2K_p K_I s + K_I^2] [J_V^2 (s^2 + K_3 s \\
& + K_2)^2 - K_2^2]
\end{aligned} \tag{2-24}$$

The expressions for the discrete describing function of the CMG nonlinearity, $N(A, n, \phi)$, may be found in [2]. In the present case, since the two axes are considered to be identical, and the couplings are symmetric, it is assumed that the amplitudes of the input signals at the two nonlinearities are identical.

The stability equation is obtained by setting $\Delta(z)$ of Eq. (2-17) to zero. It is apparent that $\Delta(z) = 0$ is of the form:

$$\Delta(z) = 1 + G_A(z) + G_B(z)N(A, n, \phi) + G_C(z)N^2(A, n, \phi) = 0 \quad (2-25)$$

which can be written as

$$1 + \hat{G}_B(T, n)N(A, n, \phi) + \hat{G}_C(T, n)N^2(A, n, \phi) = 0 \quad (2-26)$$

by dividing both sides of the equation by $1 + G_A(z)$, and setting

$$z = e^{j2\pi/n} \quad (2-27)$$

Equation (2-26) shows that in the sampled-data system, there are four variable parameters in the stability equation in T , n , A , and ϕ , whereas in the continuous-data system there are only two variables in A and ω .

2-3. Exact Solution of the Stability Equation of the Two-Axis Sampled-Data LST System by Numerical-Iterative Techniques

The numerical-iterative method described in Chapter 1 is now used to solve the stability equation of the two-axis sampled-data LST system, Eq. (2-26).

In Eq. (2-26) we define

$$\hat{G}_B(T, n) = G_{R1} + jG_{I1} \quad (2-28)$$

$$\hat{G}_C(T, n) = G_{R2} + jG_{I2} \quad (2-29)$$

$$N(A, n, \phi) = N_{R1} + jN_{I1} \quad (2-30)$$

$$N^2(A, n, \phi) = N_{R2} + jN_{I2} \quad (2-31)$$

where G_{R1} , G_{I1} , G_{R2} , G_{I2} , N_{R1} , N_{I1} , N_{R2} , and N_{I2} are all real quantities.

When Eqs. (2-28) through (2-31) are substituted into Eq. (2-26), and after grouping the real and imaginary parts, we have,

$$\Delta = \Delta_R + j\Delta_I = 0 \quad (2-32)$$

where

$$\Delta_R = 1 + G_{R1}N_{R1} - G_{I1}N_{I1} + G_{R2}N_{R2} - G_{I2}N_{I2} = 0 \quad (2-33)$$

$$\Delta_I = G_{I1}N_{R1} + G_{R1}N_{I1} + G_{I2}N_{R2} + G_{R2}N_{I2} = 0 \quad (2-34)$$

These two expressions represent two equations in four variables in A , T , ϕ , and n . It is necessary to assign values to two of these variables and solve for the remaining two using the numerical-iterative method. In general, it is practical to assign values to T and n , and Eqs. (2-33) and (2-34) are solved to yield A and ϕ . Alternatively, we may assign values to n and ϕ , and solve for A and T . The latter case has been carried out in the current study.

As in Chapter 1, we define

$$\underline{x} = \begin{bmatrix} T \\ A \end{bmatrix} \quad (2-35)$$

$$\underline{F} = \begin{Bmatrix} \Delta_R \\ \Delta_I \end{Bmatrix} \quad (2-36)$$

Then, Eqs. (2-33) and (2-34) can be written as

$$F(\underline{x}) = 0 \quad (2-37)$$

The Newton-type quadratically convergent numerical method described in Chapter 1 can now be directly applied to this two-variable system.

The following system parameters are used:

$$T_{GFO} = 0.1 \text{ ft-lb}$$

$$H = 600 \text{ ft-lb-sec}$$

$$J_G = 2.1 \text{ ft-lb-sec}^2$$

$$K_0 = 5758.35$$

$$K_1 = 1371.02$$

$$K_p = 216 \text{ ft-lb/rad/sec}$$

$$K_I = 9700 \text{ ft-lb/rad}$$

$$J_Y = 10^5 \text{ ft-lb-sec}^2$$

$$\gamma = 1.38 \times 10^7$$

Three sets of coefficients of coupling are used for this study:

$$(1) \quad K_2 \approx 0.1 \quad K_3 = 0.1$$

$$(2) \quad K_2 \approx 1.0 \quad K_3 = 0.1$$

$$(3) \quad K_2 = 5.0 \quad K_3 = 0.1$$

For each integral n , and a fixed value of ϕ , a solution of Eq. (2-37) is attempted with an initial guess on T and A . A convergent solution for T and A together with the assigned n and ϕ describes a sustained oscillation in the system. One of the characteristics of the numerical method is that the solution depends on the initial conditions set by the analyst. As shown in the earlier studies, it is quite possible that a system may have a multiple number of solutions for the same set of n and ϕ . An exhaustive search can only be conducted by a systematic scan of all the possible combinations of the initial values in the iterative process, unless one has general information at the outset on the number and the proximity of the solutions.

Figure 2-4 shows the plots of the two solutions of T versus A for $K_2 = K_3 = 0.1$, and for relative large values of n . The results are shown only for $\phi = 0^\circ$. When all the values of ϕ are used, the solutions of T and A trace out a loop in the T versus A domain. For large values of n , these loops are very small, as the solutions are relatively insensitive to n . As n decreases, these loops become more pronounced, as indicated in Fig. 2-5. As n decreases, one of the solutions disappears, as the amplitude of A becomes exceedingly small.

Figure 2-6 gives the computer results for $K_2 = K_3 = 0.1$ that correspond to one set of solutions for $\phi = 0^\circ$. Figure 2-7 tabulates the other set of results for $K_2 = K_3 = 0.1$ with $\phi = 0^\circ$. Figure 2-8 gives the tabulations of results for $K_2 = K_3 = 0.1$, $n = 4$, and variable ϕ .

Figures 2-9 and 2-10 give the results with $K_2 = 1.0$ and $K_3 = 0.1$. Figure 2-11 shows the solutions for $K_2 = 5.0$ and $K_3 = 0.1$ with $\phi = 0^\circ$. In this case, the amplitude of oscillation decreases as n decreases, so that there is less chance for the low-frequency oscillations to occur.

The results indicate that harder coupling (larger values of K_2 and K_3) tends to reduce the chance of self-sustained oscillations.
